Receiver Lines Node Deployment

- Lines of hydrophone nodes laid on seabed at 25m intervals, connected by rope.
- Laid and recovered by node vessels running east to west.
- Each receiver line is 250m to the south of the previous one, such that the survey moves gradually from East to West.

Pinging

- A vessel runs along the line using a high frequency, low volume acoustic transducer to confirm the node positions by triangulation.

Source Lines

- Air 'guns' are cylinders of compressed air that is released to create a sub-surface bubble that generates a specific sound signature.
- The air guns are suspended under floats towed by a source vessel at a speed of approximately 4.5 knots

Prior to starting a new line, the source vessel will conduct a soft start.

This gradually increases the source volume from very low volume to full volume of 1520 cu in over a period of 20 to 40 minutes.

Notice:

1. All parties to be aware that in the area indicated above, the seismic equipment will be deployed on the seabed.
2. Seismic source vessels will operate during day, so please keep a safe distance in the operation area. Fishing, anchoring and / or diving operations in this area are strictly forbidden.
3. All operating vessels will be in a restricted maneuverable condition during the seismic operation. All passing vessels must be prepared to change the route if advised.
4. To minimize any possible disruption in your operations, please contact us (as per vessel name in the following display) on VHF CH 75 for further movement information.
